

A FREE GUIDE FOR SOLOPRENEURS

5 AI Problems Every Solopreneur Hits.

And the 10-minute fix for each one. No course. No jargon.
No overwhelm, just five things you can actually do today.

BEFORE YOU START

Most AI advice wasn't written for you.

It tells you to "embrace AI" or "10x your output." It doesn't tell you what to actually do on a Tuesday afternoon, with one task and one hour in front of you.

This isn't that.

I looked at what solopreneurs are actually struggling with when they try to use AI, not what tech companies think you should struggle with. Five problems came up again and again. Different businesses, same list.

"I hear the same five problems every week in our Q&A calls. Different businesses, same list, every time."

Each one has a simple fix. None of it needs a course or a technical background.

Pick one. Do it today, then come back for the next.

PROBLEM 1 OF 5

Too many tools, no idea which one to use.

You open your laptop to write one email and end up with seven tabs open, comparing tools instead of writing. Many small business owners using AI say choosing the right tool is genuinely hard. That's the actual state of things right now, not a sign you're behind.

WHY IT HAPPENS

Many tools claim to do everything, so there's no obvious right choice. The decision itself becomes the task.

THE FIX

Pick one tool. Give it one job, and ignore everything else for 30 days. Don't pick the "best" tool. Pick the one you already have open most often, or the one a solopreneur you trust actually uses day to day. Use it for one task only, on repeat, until it's a habit rather than a decision.

DO THIS NOW

Close every AI tab except one, and delete the rest of the bookmarks. You can always come back to them later. You won't need to. That's one decision gone for a month.

PROBLEM 2 OF 5

"I don't know what I'd even use it for."

This is the single biggest reason solopreneurs don't use AI at all. Many non-users say the same thing: they can't see where it fits their business.

WHY IT HAPPENS

The question "what can AI do?" is too big. There are far too many answers, and none of them are specific to you.

THE FIX

Ask a smaller, better question: "Where am I stuck this week?" Not "how could AI change everything." Just: what's the one task you keep putting off, or doing badly because you're tired by the time you get to it? That's your starting point. Not a strategy. One task.

DO THIS NOW

Write down the one task you avoided this week. That's your first use case. Try it there, nowhere else, for now.

PROBLEM 3 OF 5

The output doesn't sound like you.

You ask for a post or an email and get back something that reads like every other AI-written post you've scrolled past. It's flat, it's safe, and it doesn't sound like anyone in particular, least of all you.

WHY IT HAPPENS

Tell the tool to be "friendly and professional" and it fills in the blanks with the most generic version of friendly and professional it can find.

THE FIX

Feed it your own words before you ask for new ones. Take three things you've genuinely written yourself: an email, a caption, a message to a client. Paste them in first. Ask it to notice how you write, your sentence length, your phrases, what you don't say. That's the difference between describing your voice and showing it.

DO THIS NOW

Find three things you've already written. Paste them into your AI tool. Ask it to describe your writing style back to you, in three sentences, and correct anything it gets wrong. Next time, it starts from you, not from generic.

PROBLEM 4 OF 5

You don't trust it enough to actually use it.

Many small business owners say they're not fully confident letting AI handle even simple tasks without checking. Fair enough. It does get things wrong, and when you're a solopreneur, a mistake goes out under your name. There's no one else to catch it first.

WHY IT HAPPENS

AI sounds confident even when it's wrong. It doesn't sound unsure, so errors are easy to miss.

THE FIX

Use it for drafts, never for final answers. Never let anything go out, get sent, or get published without you reading it properly first. Not skimming. Reading. Check anything factual against a real source: numbers, names, dates, claims.

DO THIS NOW

Pick the last thing AI helped you write. Read it again, properly, before it goes anywhere else. Notice what you'd have missed on a skim.

PROBLEM 5 OF 5

You can't tell if it's actually saving you time.

You use AI for a few weeks, it feels vaguely helpful, and then you drop it because you can't point to what it actually changed.

WHY IT HAPPENS

In my experience, tools picked up without a specific, repeated task attached get abandoned, whether they were working or not. Without a clear before and after, there's nothing to measure.

THE FIX

Time one task, before and after, for a week. Pick the task from Problem 2. Time how long it takes you without AI, once. Then time it with AI, three times over the week. Write both numbers down. That's your actual answer, not a feeling.

DO THIS NOW

Note today's date and the task you're tracking. Time it once, the old way, right now. You'll have your comparison by Friday, in writing, not a guess.

WHERE THIS LEAVES YOU

Five fixes. Five afternoons back, if you actually do them.

But notice what none of them solve. You've picked one tool, not decided how AI fits your whole business. You've found one use case, not a system for finding the next one. You've checked one piece of output, not built a habit that holds up when you're busy and tired and skip the check.

That's the real problem. Not AI. Doing this alone, every week, with no one to tell you what you're missing.

01

Learn

02

Implement

03

Connect

Learn one thing. Implement it. Then tell someone if it worked, because that's what makes it stick. It's the same pattern behind everything that actually holds, in AI or anything else.

THE SOLOPRENEURS AI ACADEMY

That loop is the whole of what we run inside the Academy, every week, with real solopreneurs working through exactly this list. Not once. On repeat, as your business changes.

Ready to stop doing this on your own?
